MAKE-READY SEQUENCING / BUSINESS CHANGE

What changes in your turnover coordination

Keep your existing PMS and vendor channels. Eliminate the coordination silence between trades.

RESEARCH REVIEWED

1,850 doors across 12 properties

Public careers & portfolio review

A NOTE FOR MARCUS VANCE

At Beacon Residential Partners, managing 1,850 doors across 12 communities means turnover lag between paint, repairs, and flooring directly inflates vacancy days. Connecting move-out notices to vendor handoffs keeps turns moving without coordinators having to chase status.

Assumed current turnover process

- **Move-out & scope logged**
  Notice or keys in PMS; punch list created.
- **Coordinators call & check**
  Staff ring trades to check if work has begun.
- **Trades finish in silence**
  Painters finish, pack up, and leave unlogged.
- **Uncertain trade handoffs**
  Flooring arrives late or before paint (rework).
- **Manual chase & data entry**
  Staff chase photos, invoices, and ready status.

With the coordination system

- **Connected notice intake**
  Notice & move-out sync to private turn record.
- **Zero-portal vendor replies**
  Trades text or email "12B done" in native apps.
- **Deterministic sequence guard**
  Enforces physical order before trades release.
- **Manager-gated next handoff**
  Fact-locked next draft; manager releases send.
- **Silence watchdog & ready QA**
  Monitors elapsed time; alerts staff if stalled.

STAYS	PMS, trade vendors, manager authority
REDUCED	Phone tag, coordination lag, out-of-order rework
ADDED	Private state database, sequence guard, approval cards, stall watchdog

What this changes for the business

Removes 2–4 days of coordination lag per turnover. Protects manager attention while keeping human approval on every message.

MAKE-READY SEQUENCING / END-TO-END WORKFLOW

From notice to verified rent-ready

What the workflow tracks, what AI interprets, and where your team decides.

1 **Notice & turn plan** — WORKFLOW

Notice or keys in PMS creates coordination record, stage template, and target date.

2 **Move-out & punch list** — STAFF + INSPECTOR

Keys returned starts vacancy clock. Punch list scope activates initial work stages.

3 **Vendor reports status** — TRADE VENDOR

Vendor texts or emails ordinary reply ("12B paint done", "delayed to Friday"). No portal login.

4 **Read & extract intent** — AI MODEL

Classifies intent (done, delay, question) and extracts unit hints. Strictly zero write rights.

5 **Deterministic safety checks** — RULES

Matcher links sender to active stage. Policy blocks duplicates, mismatch, and unknown senders.

6 **Sequence guard check** — RULES

Enforces physical order (Paint before Flooring, Repairs before Clean). Blocks out-of-order claims.

Fixed rules: unneeded stages can be skipped; prerequisites cannot be bypassed.

7 **Obtain manager approval** — TURNOVER MANAGER

System drafts fact-locked message for next trade. Manager chooses Email, Message, Both, or Skip.

8 **Dispatch, track & QA close** — STAFF + WORKFLOW

Dispatches authorized delivery; records channel status; staff verify punch list & photos before ready.

WHO HANDLES WHAT

AI Model

Reads informal vendor messages, extracts unit hints, and polishes draft tone. Never decides status or contacts vendors.

Workflow + rules

Enforces stage sequence, validates vendor assignments, scores unit matches, and tracks channel delivery.

Manager + staff

Approves every outgoing message, chooses channels, overrides exceptions, and inspects final QA.

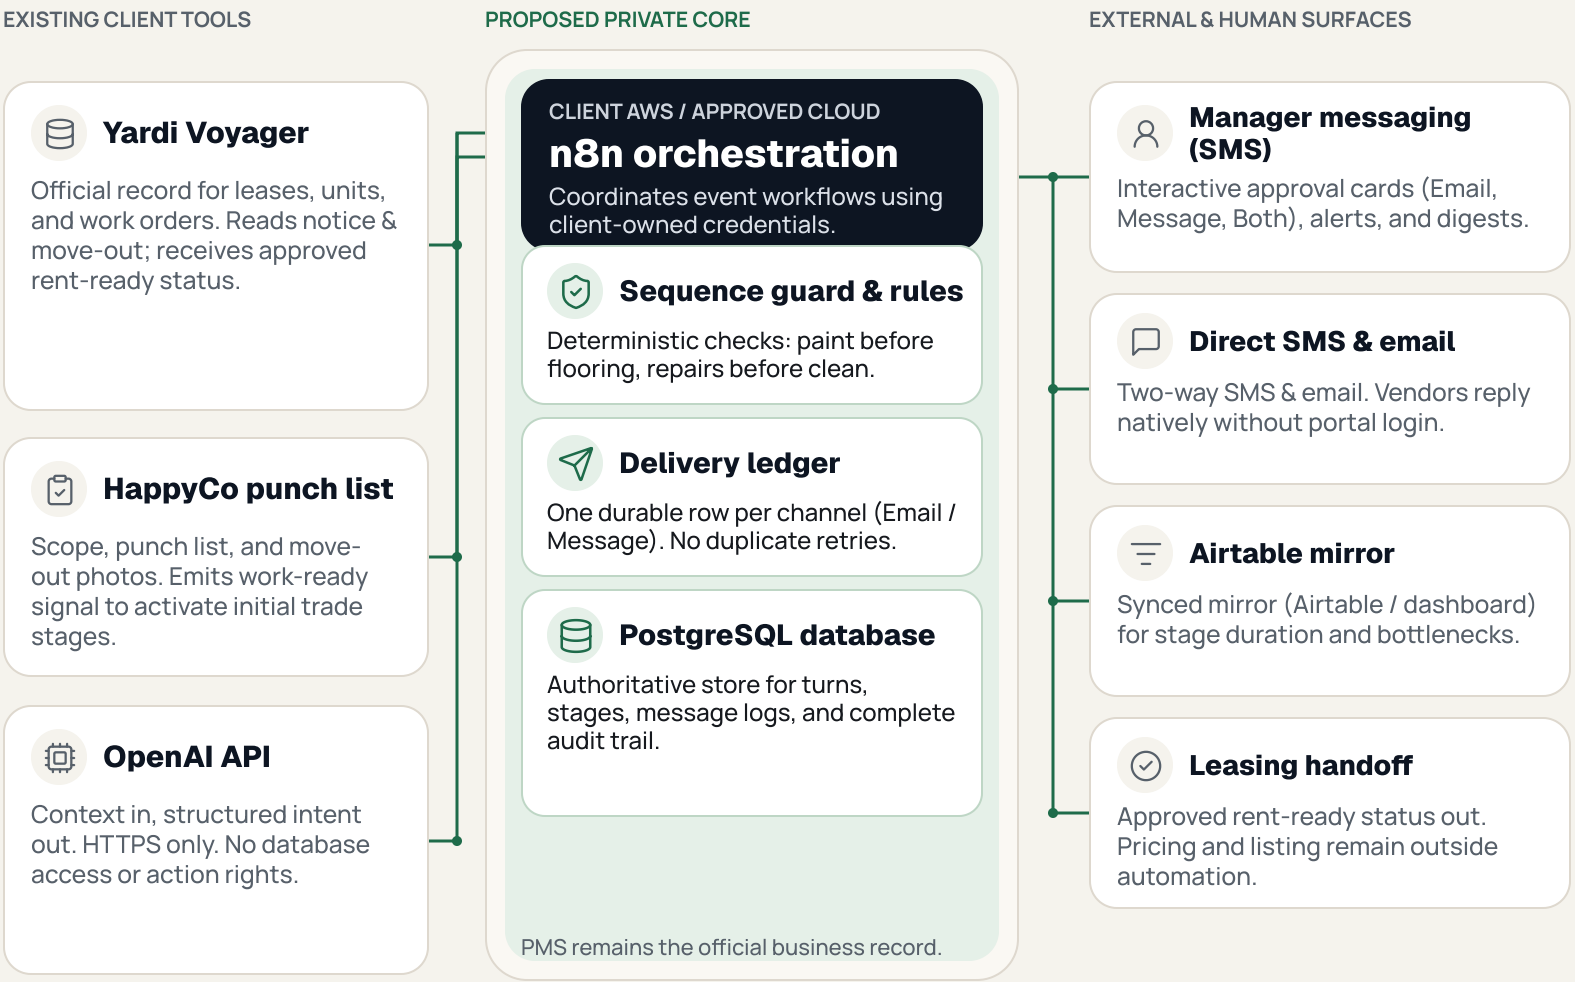

AT ANY STAGE

Ambiguous messages, unknown senders, or safety concerns route directly to named staff.

MAKE-READY SEQUENCING / TOOLS & CONNECTIONS

How your systems connect

Proposed private coordination architecture. Client keeps system ownership and data control.

ROUTES TO CONFIRM WITH THE CLIENT

Intake: Yardi notice webhook or daily turnover export

Inspection: HappyCo punch-list completion signal & photo link

Vendor: Two-way text & email; replies routed without portal login

PMS: Read notice & dates; mirror ready status upon completion

Manager: Interactive decision cards (Email / Message / Both / Skip)

Reporting: Authoritative Postgres sync to Airtable manager board

MAKE-READY SEQUENCING / OPERATIONS & OUTCOMES

How your team runs it each day

Staff retain full decision authority. No vendor message leaves without human sign-off.

Daily operating queue

Awaiting approval. Drafted next-trade messages waiting for manager release.

Silence watchdog. Alerts for active stages exceeding agreed turnaround windows; held during quiet hours.

Exception queues. Ambiguous unit matches, unknown senders, and sequence blocks remain visible.

Human decision authority

Managers release every outgoing message (Email, Message, Both). Staff select contractors, agree pricing, and authorize skips or overrides.

Security deposits, tenant damage, and legal questions route to staff with zero automated opinion.

Controls, safety and recovery

Fail-safe isolation

If AI times out or returns invalid output, the system falls back to deterministic templates and alerts staff. Vendors can only ever complete their own assigned stage.

Durable state & independent retry

Postgres state is authoritative; external mirror or PMS downtime never stalls turns. Retries act only on the failed channel, preventing duplicate contractor messages.

What a production pilot measures

Vendor reply rate
Primary indicator of automation vs manual coordination.

Auto-handled rate
Handoffs resolved without coordinator lookup.

Hours per stage
Identifies bottlenecks across individual trades.

Move-out to ready
Actual calendar days saved per turnover.
