Nothing from the painter this morning.

The paint is finished, or it never started.

Your inbox looks identical either way.

Every system records what happened.

A message arrives. A status changes. Nothing notices what did not.

Silence is the most common state in a turn.

It is the only one with no entry anywhere. It costs the same per day as any other delay.

So treat the absence as the event.

Give every stage an expected duration. Passing it with no word is information.

One alert per stage.

An alert that repeats gets muted.

A muted alert is
the same as no alert.

Business hours only.

A stall at 2am is still a stall at 8am.

Nobody was calling a flooring crew at ~~2am~~.

A snooze that means something.

If you know why it is stuck, say so.

A system you cannot quiet is one you switch off.

Track the gaps, not just the events.

What happened is recorded somewhere already. What did not happen is where the days go.
